HINGE SCREW

STERILE R

Available when needed:

The Initial K Hinge Screw™ kit comes pre-sterilized and ready to use.

Safety:

The Initial K Hinge Screw™ kit is fully traceable and has a shelf life of 5 years. Its instrumentation are “always new” and have never been opened or used before.

Storage:

Initial K Hinge Screw™ kit can be easily stored in the operating room because of its small size.

Costs:

Initial K Hinge Screw™ is a cost-effective solution. The additional costs including cleaning, decontamination, sterilization of kits are cancelled.

Contamination:

Sterile single-use instrumentation minimizes contamination risks.

Buying procedure:

Initial K Hinge Screw™ facilitates buying procedures: restocking and orders are simplified, stock management is optimized.

Kit content

> Intended purpose

Initial K Hinge Screw is part to the Initial S Range. The Initial S™ single use sterile kits consist of a set of instruments or a set of instruments and implants (washers) to be used only in trauma or orthopaedic surgery, when Newclip Technics screws for osteosynthesis are fitted.

Implants of the Stand-Alone Screws range are intended for fractures fixation, osteotomies and arthrodeses of bones in adults, appropriate for the size of the device.

> Contraindications

- Pregnancy.
- Acute or chronic local or systemic infections.
- Allergy to one of the materials used or sensitivity to foreign bodies.

Ready
when you are!

Technical features

> Hinge screw

- Cannulated screw to be guided by k-wire.
- Headless screw to be fully inserted into the bone.
- Insertion of a compressive screw into the hinge to:
 - Reinforce the bone hinge ⁽¹⁾.
 - Compress the hinge in case of fracture.

Can be used in the femur

Can be used in the tibia

> Associated single use instrumentation

• Ready when you are !

If you need to position a screw in the hinge during you knee osteotomy procedure, the Initial K Hinge screw™ kit is available already sterile.

- Instrument with a protection sleeve.

- 3-in-1 instrument for a simple use: length gauge, countersink and screwdriver.

This instrument can be either used with the handle in the kit or can be attached to a power tool.

REMARK

The Hinge screw must always be used with a plate and associated screws from the Activmotion S range (reusable instrumentation kit illustrated opposite).

For more information, please refer to the Activmotion S brochure.

Surgical technique

The technique presented on this pages is one of the surgical techniques possible. The choice is made according to the surgeon's preferences.

1. Incision

Associated with a HTO

Make an incision on the lateral side of the tibia, anteriorly to the fibular head, just at the joint line level.

Associated with a DFO

Make an incision on the opposite side of the osteotomy between the joint and the epicondyle.

4. Widen the first cortex using the countersink part of the 3-in-1 instrument through the protection sleeve.

5. In the case of high bone density, it is necessary to drill before the screw insertion. Drill to the desired depth through the protection sleeve (c).

The drilling depth can be checked at the rear of the protection sleeve using the markings on the drill bit (d).

2. Position the double guide on the cortex and insert the Ø1.6 mm pin through it.

The pin should cross the hinge at the end of the sawing plane.

Then, remove the double guide.

3. Slide the 3-in-1 instrument along the Ø1.6 mm pin and through the protection sleeve of the double guide, until the cortex is reached (a).

With the measuring gauge part of the instrument, read the depth using the marking on the pin (b).

N.B. The pin can then be inserted deeper in order to prevent its removal during the drilling.

6. Select the appropriate screw length and insert the screw along the pin using the screwdriver part of the 3-in-1 instrument through the protection sleeve until the desired reduction and compression are achieved.

Then, remove the pin.
